

## Wynsoft™ Data Vault™

Data Vault™ is a comprehensive data warehouse solution that provides out-of-the-box data integration between disparate supply chain systems. Data Vault™ business intelligence data warehouse solution, stores information from operational databases and uniquely prepares it for use by the Wynright Wynsight™ product. Data Vault's™ ability to organize information into focused, informative data marts helps to support fast access and meaningful metrics.

Data Vault™ exposes the vast multitude of data from your legacy systems and puts that data to use in new and actionable ways. Operational systems are designed and developed using database technology that facilitates the transactional day-to-day processing that runs your business: shipping daily orders, receiving product, and managing inventory. These databases are not designed for the heavy analysis required to turn this data into actionable information. Data Vault™ retrieves this data and places it into a sophisticated database model designed for decision support. This type of database supports the complex analysis needed to take your operational data and convert it into a strategic view of your operation. No matter what part of the organization you are focusing on, Data Vault™ can provide holistic and exception-based views of your real-time and historical performance. These views expose both the opportunities and the weaknesses of your supply chain. No longer will the concerns of maintaining a smoothly running transactional database, such as purging data, affect your ability to perform long term trending and analysis.

### Our Data Vault Module features:

- Integration of data from multiple supply chain areas provides the ability to uncover inefficiencies otherwise hidden within standalone systems
- Integrating supply chain data allows greater visibility of the entire supply chain
- Purchasing an out-of-the-box supply chain data warehouse reduces the expense of internal design and development projects, thus reducing the cost of internal IT resources
- By capturing and integrating data from external third party systems, companies can reap the benefits of an enterprise class supply chain system, without the cost and complexities of actually implementing one
- Data Vault™ can be licensed as a software-as-a-service (SaaS) offering, in order to reduce initial hardware and capitalization costs
